Executive Summary: Current Laundry PICK-UP, DELIVERY & CUSTOMER COMPLAINT HANDLING Operations

This report provides an overview of the shop's current pick-up, delivery, and customer follow-up processes. The ultimate goal of this review is to help transition the business into a stable, systematized operation. Once systematized, the process should run 100% without the owner's direct intervention, allowing the owner to step back, simply monitor the progress, and scale the operation to multiple branches or other complementary businesses.

The Owner's Current Pain Points

Right now, the entire business model depends on the owner acting as a human dispatcher. This creates severe personal and operational stress:

- The owner is currently juggling a full-time office job while acting as the main dispatcher, and the other team members are already seniors, which places the heavy burden of daily coordination entirely on the owner.
- Some walk-in customers who drop off their laundry will later request that the shop deliver it, or they will send a message to the owner via text, Viber, or Messenger requesting delivery instead of returning to pick it up themselves.
- The owner always needs to remind the laundry rider to deliver clean laundry backlogs from prior (previous) days
- The owner cannot sleep in or take a vacation leave because they must constantly manage orders and customer complaints on their phone.
- The system is extremely fragile. If the owner travels to a nearby province and loses cellular signal or mobile data, the entire shop's operation will fail because no information can be passed to the staff.

Current Process Overview

- **Pick-Up:** Customers request a pick-up using text, Viber, or Facebook Messenger. The owner gathers their information and sends the dispatch details to a staff group chat. The rider then goes to the customer to collect the items.
- **Delivery:** Once the laundry is clean, the rider groups the deliveries by area. The items are handed over to the customer personally or left at a condo lobby.
- **Customer Follow-ups:** Customers send inquiries or complaints directly to the owner. The owner acts as a middleman between the customer and the shop staff to resolve the issue.

Critical Bottlenecks & Vulnerabilities (but not limited to)

The current process is highly vulnerable because all daily operations are routed manually through the owner. The critical bottlenecks include:

- **Manual Order Processing:** The owner must manually ask for details from new customers and dig through old chat histories for existing customers. The owner then manually types and sends these details to the staff group chat.
- **Visual Communication Blockers:** For contactless condo lobby pick-ups, the customer sends a photo of their laundry bag to the owner. The owner must be online to save and share this photo with the rider so the rider can find the bag.

- **Time-Consuming Payment Steps:** For lobby deliveries, the owner has to manually message the customer with the final bill and a GCash QR code. After the customer pays, the owner must manually log into their GCash app to check if the payment is valid before sharing the receipt details with the staff.
- **"Middleman" Customer Service:** When a customer asks for a status update, the owner must forward the message to the staff chat, tag the rider or attendant, wait for them to reply, and then type out a response back to the customer.
- **Optional Delays Communication:** Delays due to shop machine volume are communicated to the customer optionally. This lack of standard procedure triggers unexpected customer status inquiries and complaints that the owner must manually resolve.
- **Manual Cash Tracking:** Cash collection relies heavily on a physical paper logbook signed between the rider and the attendant. There is no centralized digital logging system for cash, which makes remote auditing difficult for the owner.

Sequential PICK-UP Process Flow

1. **Inquiry & Initial Response**
   The customer sends a message requesting a laundry pick-up via Text, Viber, or FB Page messenger. The owner replies to the customer on the same platform used for the inquiry.

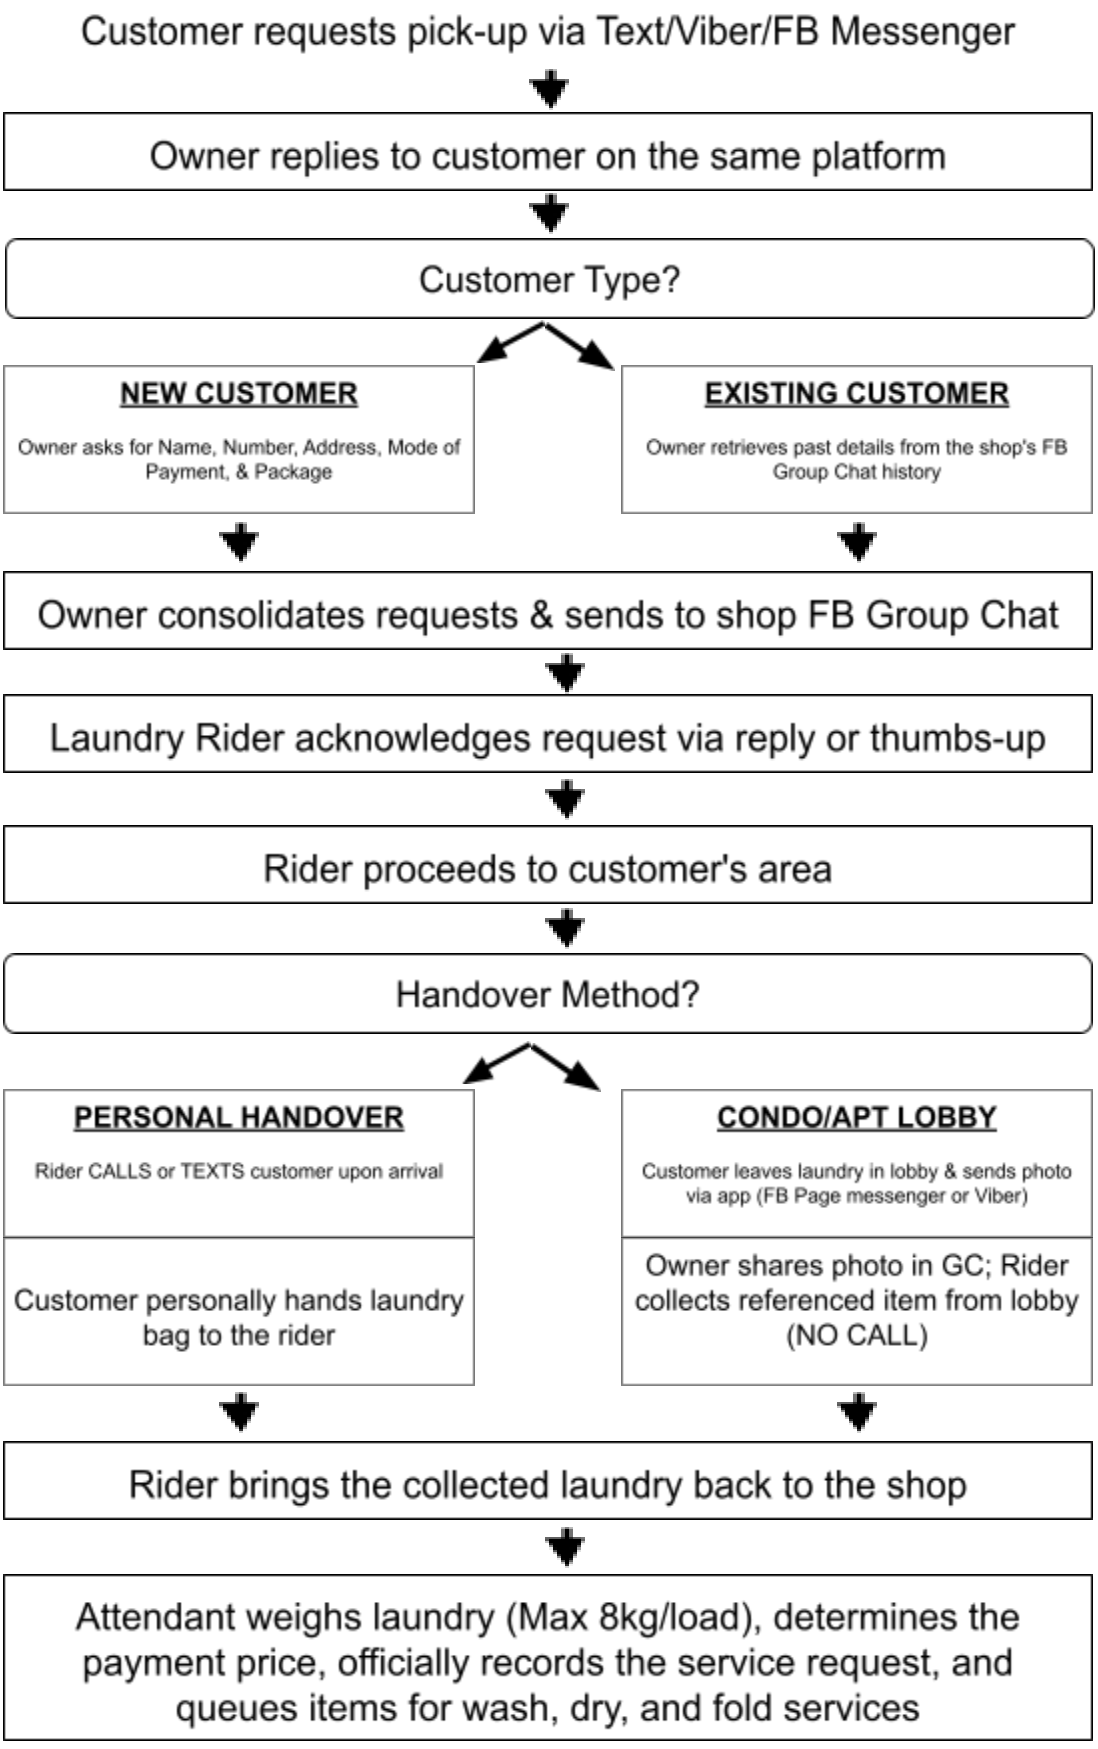

2. **Customer Information Gathering**
   - **For New Customers:** The owner requests registration details: Complete Name, Contact Number, Pick-Up & Delivery Address, Payment Mode (Cash/GCash), and Package Choice (Premium at ₱235 or Deluxe at ₱210).
   - **For Existing Customers:** The owner retrieves the customer's historical details from the shop's FB Messenger Group Chat and copies them into the current request.

3. **Request Consolidation & Dispatch**
   The owner consolidates the day's pick-up requests and posts them to the shop's FB Group Chat (containing the owner, laundry shop attendant, and rider). The laundry rider acknowledges the dispatch by replying or sending a thumbs-up.

4. **Arrival & Segmented Handover**
   The Laundry Rider travels to the customer's location. The process then splits based on the chosen handover method:
   - **Personal Handover Route:** Once in the area, the rider calls or texts the customer to notify them of arrival. The customer then comes out to personally hand the laundry bag or basket to the rider.
   - **Condo/Apartment Lobby Route:** The rider does not call or text the customer. The customer leaves the laundry in the lobby and sends a reference photo of the bag/basket via FB Messenger or Viber. The owner shares this photo in the shop GC, and the rider uses it to locate and collect the correct item directly from the lobby.

5. **Shop Processing & Queueing**
   The rider brings the collected laundry back to the shop. The Laundry Shop Attendant weighs the load (maximum 8kg per load), calculates the final price, officially logs the service request, and places the items into the wash, dry, and fold queue.

PICK-UP Process Flow Chart Map

Sequential DELIVERY Process Flow

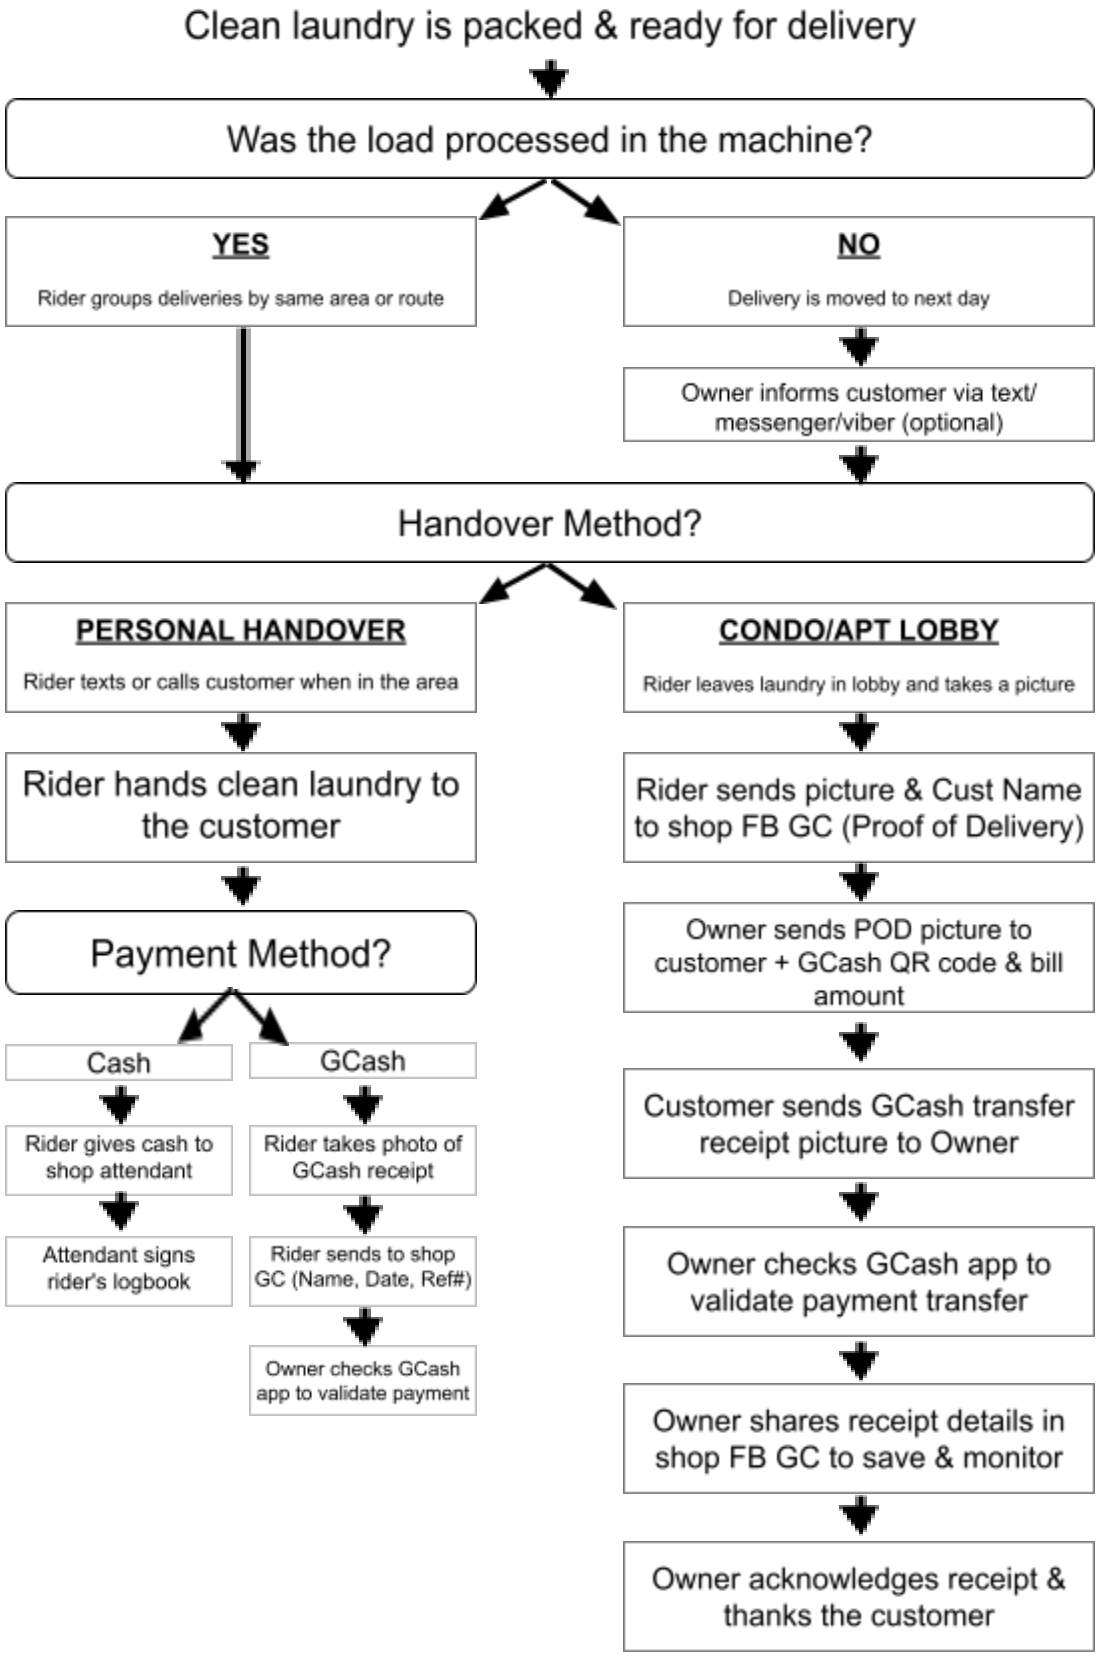

1. **Sorting & Route Optimization**
   The shop strictly operates on a first-in, first-out (FIFO) basis. Once the clean laundry is packed, it is handed over to the laundry rider for delivery. The rider groups deliveries that are in the same area or along the same route to maximize efficiency.

2. **Capacity Management (Next-Day Exception)**
   Normally, the shop provides same-day delivery. However, if the laundry cannot be loaded into the machine due to volume, delivery is pushed to the next day. In these cases, the owner may inform the customer via text, Messenger, or Viber so they are aware of the next-day delivery schedule.

3. **Handover Execution & Proof of Delivery**
   The delivery process splits depending on how the items are handed over:
   - **Personal Handover:** The laundry rider will text or call the customer when they are in the area to personally hand over the clean laundry.
   - **Condo/Apartment Lobby Drop-off:** The rider places the clean laundry in the lobby and takes a picture of it. The rider then sends this picture, along with the customer's name, to the shop's FB Group Chat as proof of delivery. The owner copies this picture and sends it to the customer (via FB Messenger or Viber) to inform them their laundry has been delivered.

4. **Payment Collection & Validation**
   The billing and payment collection process aligns with the handover method:
   - **For Personal Handovers (Cash):** The customer pays the rider in cash. Upon returning to the shop, the rider hands the cash to the laundry shop attendant and has them sign a cash payment receiving copy in the rider's logbook.
   - **For Personal Handovers (GCash):** The rider takes a picture of the customer's GCash transfer receipt. The rider sends this picture to the shop FB Group Chat along with the Customer Name, Payment Date, and the Last 4 digits of the GCash reference number. The owner then checks the GCash app to verify that the payment successfully went through.
   - **For Lobby Drop-offs (GCash):** When sending the proof of delivery photo to the customer, the owner simultaneously sends the GCash QR code and the bill amount. The customer sends a picture of their GCash transfer receipt to the owner. The owner shares this receipt to the shop FB Group Chat with the customer details (Name, Date, Last 4 digits of ref number) for monitoring. Finally, the owner checks the GCash app to validate the receipt; once verified, the owner acknowledges the payment and thanks the customer.

Delivery Process Flow Chart Map

Sequential CUSTOMER FOLLOW-UP Process Flow

1. When a customer follows up or complains about their laundry status or delivery schedule via text, Messenger, or Viber, the owner immediately forwards the message to the shop's FB Group Chat.

2. The owner tags the laundry rider or shop attendant in the group chat so they can provide a status update.

3. Once the rider or attendant replies in the group chat, the owner relays the status update to the customer.
